Scott Galloway, professor of marketing at NYU's Stern School of Business, has some harsh words for the Oculus Quest 2. He's gone so far as to call it a sexual depressant, an object that's so unappealing it will prevent humans from bearing children. VR is a prophylactic ensuring you will never conceive a child, as no one will want to get near you. (In this case, ensuring nothing gets done as colleagues won't want to work with you.) 20, 2021 See more! It's a harsh, if humorous take on the world of virtual reality, one that's becoming increasingly dominated by Mark Zuckerberg's Meta. The Oculus Quest 2, now named Meta Quest 2, is the most accessible VR headset on the market. At \$300, it can play a good majority of titles on our best VR games list, as well as social VR experiences like VRChat. And it can do so without being plugged in to an expensive gaming PC. But still, it was long seen as a niche product, only for those that were into cutting edge gaming or simulation racing. But this past Christmas, videos started flooding the internet of Quest 2 unboxings and funny first experiences (opens in new tab). It's clear that Mark Zuckerberg's VR headset was the must-have gaming gadget of the season. One particular video began circulating on Reddit of a kid opening up his Christmas gifts. The video, posted on a subreddit that we can't name as it violates our style guidelines, shows a kid frantically opening up his Christmas gift to find an Oculus Quest 2 inside. He then proceeds to totally freak out. You can find the video here (opens in new tab). Warning: turn down the volume. Seeing this kid screech like a mythological banshee and then proceed to "Naruto run" across the living room filled me with second-hand embarrassment and

joy. I was embarrassed because I could easily see myself as that kid. But I felt happy for him as he probably experienced a level of happiness I haven't had since I too was a kid opening up a highly desired gift. Thankfully, no video of me engaging in such a level of hysteria exists online. But it did remind me of another viral video from nearly two decades prior, the famous Nintendo 64 video. In it, a brother and sister freak out just as much over receiving Nintendo's cartridge-based console. And here's the thing. The Nintendo 64 was a proper mainstream gaming device. It's gone down as an important part of gaming history, bringing genre-defining titles such as Super Mario 64 and The Legend of Zelda: Ocarina of Time. I never really considered the Quest 2 to be in the same league as the N64. But as I continued browsing through subreddits, I came to see the VR headset graduate to the next level of mainstream. And I could tell by the number of posts complaining about kids ruining online multiplayer.(Although Meta does not permit (opens in new tab) kids under the age of 13 from making an account, one could play games on a Quest headset using a parent's Facebook page.)One post pleaded with parents to not let little kids play multiplayer games. In the Reddit thread, user Ok Priority 3281 (opens in new tab) said kids are "usually toxic, annoying and stupid." In another Reddit thread, user johnnydaggers (opens in new tab) claims that kids have made using apps such as Echo Arena and VRChat downright caustic, insisting he would sometimes find himself "surrounded with kids spewing racism, sexism, sexually explicit conversations, etc.""I suspect it's due to a mix of immaturity crossed with anonymity and a sense of disembodiment while inhabiting a virtual avatar," said user johnnydaggers.In fact, johnnydaggers went so far as to make a post on Oculus' User Voice forums (opens in new tab) adding suggestions on how the platform can deal with mass adolescent toxicity. As frustrating as it might be for Quest 2's early adopters, the cat is out of the virtual bag. During Black Friday, the Quest 2 was a top-selling item on Amazon. Retailers like Best Buy had Quest 2 headsets stocked to the ceiling (opens in new tab). Any recent flood of toxic kids and teens into VR spaces is indicative of how far Meta has been able to push VR into the mainstream. At this point, no level of online pleading with parents will help control the influx of young'uns craving the tiniest smidges of agency afforded to them. And let's face it, parents probably want a break from some of those kids too. Much to the chagrin of Professor Galloway, the Quest 2 has gone mainstream. Whether it will lead to a birthrate crisis two decades from now remains to be seen. Today's best Oculus Quest 2 Elite Strap with Battery and Carrying Case deals (opens in new tab) (opens in new tab)View Deal (opens in new tab) (opens in new tab) (opens in new tab)View Deal (opens in new tab) This guide will show you step by step how to incorporate rumble motors internally in a stock Nintendo 64 controller. Traditionally, a large rumble pak with batteries must be inserted into the controller in order to experience the rumble feature. This mod will not require batteries to run, and will also leave the controller slot open for memory cards or other peripherals.Here are the main components you will need to complete this mod:Nintendo 64 controller2 Nintendo 64 Rumble Paks (NUS-013)Soldering iron/flux/solder24AWG stranded copper wireWire strippers3.8mm gamebitPhilips screwdriverScissorsRazor bladesRotary tool such as a Dremel (optional)Electrical tapeDual pole dual throw switchesHot glue gun/hot glueYou will need original Nintendo NUS-013 rumble paks for this mod. You can use one or two depending on how much rumble you want. I chose to use two and that's what I will be demonstrating in this guide.Use a 3.8mm gamebit to remove the two screws and open up the rumble pak.Carefully disconnect the rumble motor from the circuit board.Set aside one circuit board and two rumble motors.In order to fit the rumble pak circuit board in the controller, we will need to physically trim it down. Be very careful to only trim as far as I went in the third and fourth images. You also want to trim down the gold contacts at the bottom by about half their full length.I used normal scissors for the bulk of the trimming and a sharp razor blade for the finer bits. In order to allow the rumble pak to run without batteries, you need to bridge two contacts on the circuit board. Solder a wire between the two points circled in red. I used 24AWG stranded copper wire for this.Add a wire about 6" in length to each of these points for the positive and negative output to the rumble motors. Disassemble your N64 controller by removing the 9 Philips screws on the bottom of the controller. Set the buttons, joystick, and circuit board aside.Remove the plastic support underneath the d-pad location on the left side of the controller. We need this space to fit the rumble pak circuit board. Simply use a sharp razor blade or a Dremel tool if you have one.The second and third images give you and idea of where all the components are going to go.Use flux and solder to tin all of the contacts on the circuit board.You will need to add a wire approximately 6 inches in length to each of these pins: 1, 2, 12, 13, 14, 16, 18, 19, 20, 25, 27, 28, 29, 30, 31, 32.Note: pins 1, 16, 17, and 32 are clearly labeled on the circuit board. All pins in between are in sequential order.The finished product should look something like the third and fourth images.It's imperative to label the wires according to their respective pins. It will make it much easier later on. I used small pieces of scotch tape and a sharpie to make simple labels for each.Use electrical tape to cover the exposed rumble pak circuit board, allowing the wires to run out as shown in the image.This should give you a general idea of where the finished wires will run. We will need to add two switches in order to allow the mod to function properly. One switch will allow us to use memory cards and other peripherals. The second switch is optional but will allow you to shut off one of the two rumble motors.For switches, I used the C&K OS203011MS1QP1 dual pole triple throw model from Mouser.com. These ended up working out pretty well after some slight modification. I had to shorten the contacts on the bottom of the switches as shown in the image. Left is a stock switch, right is my modified version. This will allow it to fit in the limited space available. Note that these are triple throw switches, though only double throw are actually needed.The second image shows roughly where the switches will be mounted.Make two slots to allow for the switches to be accessible. I used a drill and small drill bit but a Dremel tool or similar would be ideal. Install the switches and use hot glue to fill in the space behind them so they stay in place.I chose to run short wire leads off the switches before installation to allow for easier access, as shown in the image.With the left switch, you want to switch pins 18 (rumble pak detection) with one pole, and 31 (3.3v) with the second pole.With the other switch, you want to switch the positive wire of the second rumble motor. I chose to switch the left rumble motor and leave the right one always connected.Place the rumble motors in these locations in the wings of the controller. Carefully apply hot glue underneath and around them where you can to hold them in place, making sure to not obstruct the movement of the motor shaft. They fit pretty tightly even without the hot glue, but will be vibrating a lot so better to be safe.They should just barely fit in the space available.Now it's time to connect the rumble pak circuit board to the controller circuit board. Simply solder all the numbered pins of the rumble pak to their respective pins on the top of the controller circuit board. Again, all the pins are clearly labeled on the controller circuit board and in sequential order.Pins 18 and 31 should be running from the rumble circuit board, through separate poles on the first switch, and then to the controller circuit board to allow the rumble pak to be disconnected.The positive and negative rumble motor output wires from the rumble circuit board should be wired to the rumble motor(s). Now comes one of the most difficult parts: getting everything to fit in the controller. It's a tight fit but you should be able to route all of the wires where they need to go.The images above shows roughly the routing you want to use.Extra wires going to the controller circuit board can be tucked in the space circled in blue. The rumble motor related wires can be run along the path of the red line.Note that all the wires you are running should be routed below the controller circuit board.Carefully close the controller making sure not to pinch any wires. It can be very frustrating to get everything to fit, but keep working at it and it will eventually close.Congratulations! If you managed to actually get your controller to close, you now have a fully functional N64 controller with built in rumble!To use controller paks (N64 memory cards), simply flip the left switch to disconnect the internal rumble circuitry before inserting your controller pak. When you are done, remove the controller pak and flip to switch again to turn on rumble. The way the N64 works, both devices cannot be connected at once. You will corrupt your controller pak if you try to insert it when the rumble is still active.If you want less rumble, flip the right switch to disconnect one of the rumble motors. Not that you would ever want to do that, but you have the option.Also note that you should only use one of these modified controllers with your system at any one time. The N64 console only has enough energy to safely power two rumble motors directly off the console. Additional controllers can safely use traditional battery rumble paks alongside your modified controller.Please let me know if you have any questions. It took a lot of research to get this working and I'm more than happy to share it with you all.
